

TaurEye — Independent Product Review

A fintech, institutional-investment & trading perspective · NSE/BSE end-of-day equity screener (web + Android) · Reviewed 16 Jun 2026

1. Executive summary

TaurEye is a well-engineered, mobile-first end-of-day (EOD) equity screener for Indian markets (~5,800 NSE/BSE stocks). It bundles rule-based screening, a plain-English (natural-language) screen builder, client-side technical indicators and chart-pattern detection, lightweight charting, EOD alerts, and an LLM-assisted stock commentary/report — delivered over a fully static, precomputed data bundle with a Supabase cloud layer for accounts, a credit wallet and AI.

Verdict. As a retail discovery and idea-generation tool, it is genuinely strong: fast, clean, SEBI-aware, and differentiated by its natural-language screener and built-in AI. Measured against institutional / professional trading standards it is, by design, a narrow slice — it is EOD-only, equities-only, with no real-time data, no derivatives/options analytics, no backtesting, and no portfolio, risk or execution tooling. The right framing is a premium retail screener, not a professional terminal — and on that basis the foundation is commercially credible.

Overall rating: 3.4 / 5 — a polished retail EOD screener with a clean compliance and monetization base; institutional-grade analytics are absent and would be a major build.

2. Product & architecture

- Static EOD model. A nightly job ingests EOD data into a SQLite spine, corporate-action-adjusts it (every series anchored so the latest bar = current price), and exports a JSON bundle (metrics, fundamentals, indices, per-symbol candles) served by nginx. The frontend does all screening/indicators/patterns client-side.
- Cloud layer (Supabase). Auth, an unforgeable server-side credit wallet (RLS + SECURITY DEFINER RPCs), and AI via Edge Functions (LLM key server-side, credits charged there).
- Distribution. Web (instant deploys), Android (Capacitor), with over-the-air web updates (Capgo) wired.

Assessment. The static-bundle architecture is an elegant cost/scale choice for EOD data: cheap, fast, CDN-friendly, resilient. The trade-off is structural — it cannot deliver intraday/real-time data, and any feature needing live computation (order flow, live options chains) is out of scope without a different backend.

3. Capability assessment

Screening & discovery — strong. Filterable across the full universe with no result cap (paginated), 16+ curated presets (golden/death cross, RSI extremes, 52-week breakouts, volume spikes, relative-volume, ATR/low-vol, large-cap filters), and a standout natural-language screener that maps plain English to filters (Chartink-style) over signal flags such as `golden_cross`, `macd_bull_cross`, `gap_up/down`, `new_high_52w` and relative volume. This is the product's sharpest differentiator.

Technical analysis — good. Indicators include RSI-14, MACD histogram, SMA-20/50/200 (and % distance to each), 52-week high/low distance, ATR%, relative volume, and signal flags (golden/death cross, 20/50 cross, MACD cross, gaps, volume spike). Rule-based pattern detection draws lines for Cup & Handle, Double Top/Bottom, Flag, Doji, Hammer, Shooting Star, Engulfing, MA cross and 52-week extremes.

Fundamentals — basic. Quarterly financials (revenue, net profit, PBT, EPS, expenses), shareholding (promoter holding & pledge, FII/DII), corporate actions and filings are ingested. There is no deep, normalized ratio suite (P/E, P/B, ROE/ROCE, debt/equity, 10-year history, cash-flow/balance-sheet quality), which is the core of fundamental screeners like `screener.in`.

Charting — good (retail). Native lightweight-charts with MAs and an optional TradingView widget; auto-drawn patterns are a nice touch. Not a professional charting surface (no drawing tools suite, multi-pane studies, or tick data).

AI commentary & reports — promising, watch guardrails. Haiku-class model produces factual commentary and a structured report, charged server-side with refund-on-failure and a SEBI disclaimer. Quality and hallucination control and keeping output strictly non-advisory are the key ongoing risks.

4. Data quality & integrity

- Corporate-action adjustment and continuous ISIN-regime stitching are handled — important and often mishandled by retail tools; a real strength.
- EOD freshness now publishes the same trading day's close on the evening run (recently fixed); a freshness stamp (data_date) is surfaced in-app. Notifications now fire only when the date actually advances.
- Coverage caveats. ~1,500 symbols are 'quarantined' and market-cap is unmatched for a meaningful subset (universe ~4,600–4,800 of ~5,500), so breadth/market-cap screens are directional, not exhaustive.
- Single-source EOD risk. A provider outage or archive/URL change silently freezes data; needs monitoring and a fallback source for production-grade reliability.

Assessment. Data hygiene is above typical retail standard, but it is single-source EOD with a non-trivial quarantine rate — acceptable for screening/education, not for anything execution-sensitive. The app correctly states data is not suitable for trade execution.

5. Institutional & professional gaps

Against a professional trading/investment workflow, the following are absent by design and define the ceiling of the current product:

- No real-time / intraday data, no Level-2 depth, no order-flow or VWAP/microstructure analytics.
- No derivatives analytics — despite F&O context, there are no option chains, Greeks, OI/PCR, IV, or futures basis tools. A large gap for an Indian trading audience where F&O dominates volumes.
- No backtesting / strategy validation — screens cannot be tested historically; signal efficacy is unproven.
- No portfolio, P&L, risk or attribution — no holdings, exposure, drawdown, factor or benchmark analytics.
- No quant/factor models (value/quality/momentum scores, multi-factor ranking) or alternative data.
- No execution / OMS / broker order routing — broker links are affiliate sign-ups, not trading integration.
- Shallow fundamentals vs. dedicated fundamental platforms (no normalized 10-yr ratios / statements).

6. Trading & investment utility

Best fit: positional / swing and investor idea-generation on daily timeframes — breakout, trend (above-MA), mean-reversion (RSI), volume-thrust and 52-week setups, plus a fast watchlist/alert loop. The relative-volume and gap/52-week signals are practical screening primitives.

Not suitable for: intraday/scalping, options/derivatives strategies, systematic/quant execution, or any institutional mandate requiring auditable data, backtests and risk controls. Pattern detection is heuristic and should be treated as a visual aid, not a validated signal.

7. Compliance & regulatory (India)

- Strong non-advisory posture: factual-only framing, prominent SEBI disclaimers, explicit 'not a Registered Investment Adviser/Research Analyst', no buy/sell/target/tips. Legal pages (Terms, Privacy/DPDP, Refund, Disclaimer) are in place; broker promotion is framed as demat sign-up, not stock recommendation.
- Closed-loop credits (non-cashable) to stay clear of RBI prepaid-instrument rules; 18% GST acknowledged.

- Watch-items: AI output must stay strictly non-advisory at scale (the highest regulatory risk); preset names and any 'idea'/'pick' language should avoid implied recommendation; substantiate factual claims; finalize lawyer review and fill the legal-entity details before public launch.

8. Security & data protection

- Good: server-authoritative wallet, row-level security, a security_invoker balance view, locked-down EXECUTE grants on SECURITY DEFINER functions, secrets server-side only, refund-on-failure on paid AI.
- Gaps: production still serves over cleartext HTTP (blocks iOS ATS; weak trust signal) — HTTPS is the top pre-launch fix; leaked-password protection is off (gated behind a paid tier); single-VM hosting is a single point of failure with no stated DR.

9. Monetization & commercial model

Free tier + ads + broker affiliate, with credits metering premium AI and a future Pro subscription. Credit economy is live and server-charged (AI 10, report 5); AI unit economics look healthy (model cost far below credit price). Sensible, diversified, and well-staged. Risks: AI cost drift if usage scales, thin moat (signals are replicable), and conversion dependence on the AI/Pro value being compelling vs. free incumbents (Chartink) and deep fundamental tools (screener.in).

10. Scorecard

Dimension	Rating	Note
Screening & discovery	4.5 / 5	NL screener + presets; the standout strength
Technical analysis	4.0 / 5	Solid indicator/flag set; heuristic patterns
Charting	3.5 / 5	Clean retail charts; not a pro surface
Fundamental analysis	2.5 / 5	Quarterlies + shareholding; no deep ratios
Data quality / freshness	3.0 / 5	CA-adjusted EOD; single-source, quarantine rate
AI commentary / reports	3.5 / 5	Differentiator; guardrails are the risk
Derivatives / options	1.0 / 5	Absent — major gap for Indian traders
Institutional / quant tooling	1.5 / 5	No backtest / portfolio / risk / factors
Compliance posture (retail)	4.0 / 5	Strong non-advisory framing + legal pages
Security & data protection	3.5 / 5	Good cloud security; HTTP/DR gaps
Monetization design	4.0 / 5	Diversified, well-staged, healthy AI margin
Mobile UX / polish	4.0 / 5	Fast, clean, mobile-first

11. Recommendations (prioritized)

Near-term (pre-launch / weeks):

- Ship HTTPS on the VM (unblocks iOS, trust, SEO); complete lawyer review and legal-entity details.
- Add EOD data-quality monitoring (freshness + coverage alarms) and a second EOD source as fallback.
- Tighten AI guardrails: enforce non-advisory output, add evaluation/QA on samples, log and review.
- Reduce the quarantine / market-cap-unmatched rate to make breadth and cap filters trustworthy.

Medium-term (differentiation):

- Add backtesting for screens/signals — the single highest-credibility upgrade for a screener.
- Add a watchlist portfolio view (returns, exposure, simple risk) — natural next step from watchlists.
- Deepen fundamentals into normalized ratios + multi-year history to compete with fundamental tools.

Strategic (new TAM):

- Derivatives module (option chain, OI/PCR, IV, basis) — the biggest Indian-trader gap; needs a live feed.

- Quant/factor scores (value/quality/momentum ranking) as a premium, defensible layer.
- Optional near-real-time tier for active traders (separate live backend from the static EOD bundle).

Prepared as an independent expert review of the current build. Ratings are qualitative and reflect a professional-standards lens; TaurEye is positioned and disclaimed as an information/education tool, not investment advice. This document is an assessment, not a recommendation to invest.
