

TaurEye

WATCH. ANALYZE. TRADE.
Product Status — “Where We Are”

NSE / BSE end-of-day stock screener · web + Android

Product Snapshot

- EOD screener covering ~5,800 NSE/BSE stocks
- Mobile-first, beginner-friendly, plain-English screening
- Positioning: bundle what screener.in / Chartink / Trendlyne paywall — free to start, Pro at Rs 999/yr vs their Rs 2.4k-6k
- Wedge: speed, unified fundamentals + technicals; swing / positional + investor focus (concede intraday)

How We Compare

- screener.in — deep fundamentals, ~Rs 5,000/yr, weak technicals & mobile
- Chartink — technical & intraday scans, ~Rs 2,400/yr, no fundamentals, cluttered UI
- Trendlyne — broad data + scores, Rs 999–6,000/yr, overwhelming & pricey
- TradingView — world-class charts, ~Rs 12,000/yr in INR, not India-focused
- TaurEye — fundamentals + technicals + plain-English search + AI, mobile-first, free / Rs 999 Pro

Pricing & Plans

- Free — full NL + technical screener, key fundamentals, 1 watchlist, limited AI via rewarded credits
- Pro Rs 999/yr (or Rs 149/mo) — no ads, unlimited screens & watchlists, EOD alerts, generous AI
- Pro+ Rs 1,999/yr (later) — priority AI, advanced patterns, export, portfolio
- Credit packs — Rs 99 = 100, Rs 299 = 350, Rs 599 = 750 credits
- Undercuts screener.in (Rs 5,000) and Trendlyne (up to Rs 6,000) while bundling more

Architecture — Fully Static

- Nightly cron pulls EOD data into a SQLite spine, corporate-action-adjusts it
- Exports a JSON bundle (metrics, fundamentals, indices, per-symbol candles)
- nginx serves the SPA + bundle; the frontend does all work client-side
- Supabase is the only live service: accounts, credit wallet, Edge Functions

Core Screening & Analysis — Live

- Filter-based stock screener over the metrics bundle
- Natural-language screener (plain English → filters) — signature feature
- Charts: native lightweight-charts + TradingView toggle, timeframes, moving averages
- Auto chart-pattern detection drawn as lines
- Per-stock Key Data (RSI, SMA50/200, 52w, ATR) with SEBI disclaimer
- Scrip search and global indices dashboard

Engagement & Retention — Live

- Watchlists
- EOD price alerts (above / below)
- Native push notifications via Firebase (FCM)
- Saved screens
- Light / dark theme
- Accounts: Supabase email/password + guest mode

Accounts & Cloud Wallet — Live

- Supabase accounts (sign up / log in / guest)
- Server-side credit wallet with real balance
- Signup bonus (50 credits) + daily claim (5) via secure RPCs
- Balances unforgeable (server ledger + row-level security)
- Referral program: tables + page exist, reward grant not yet wired

AI & Reports — Built, Staged

- AI stock analysis via Supabase Edge Function (Claude Haiku, factual + disclaimer)
- Needs Edge Functions deployed + Anthropic API key to go live
- Advanced report feature present as a credit sink
- Charging stays off until AI + purchases are live

Monetization Status

- Broker affiliate (Zerodha): **LIVE** and earning
- Cloud wallet faucets: **LIVE**
- Ads (AdSense web + AdMob app): BUILT, gated on your IDs
- AI analysis credit sink: BUILT, needs Edge Functions + API key
- Razorpay credit purchases: BUILT, needs account + webhook
- Credit charging: OFF by design until features + top-up path are live
- Pro subscription: planned (Phase D)

Traction & Targets

- North-star: monthly active users (MAU) and free-to-paid conversion
- Funnel tracked: installs, signups, screens run, AI calls, demat signups
- Four revenue legs: affiliate, ads, credits, Pro subscriptions
- Illustrative model at ~25k MAU/mo: affiliate Rs 35-50k, ads Rs 40-55k, Pro Rs 60-100k, credits/Pro+ Rs 30-50k
- Target blended: Rs 1.8-2.6 lakh/mo — projection; early stage, actuals filled as they come

Platforms & Distribution

- Web: live on the VM via nginx, deploys from main in ~1 minute
- Android APK: builds via GitHub Actions
- Over-the-air updates (Capgo): wired, ships web bundles to installed apps
- iOS: scaffolded via Capacitor, not a current build target

The Two Product Cycles

- Data cycle (nightly, VM): ingest EOD → reconcile → corporate-action adjust → indicators → export JSON
- Release cycle (code): push to main → GitHub Actions builds SPA → rsync to nginx (excludes data) → live
~1 min
- Mobile: same push ships OTA; native changes need an APK rebuild

Compliance & Guardrails

- SEBI: factual-only pages, prominent “not investment advice” disclaimer, descriptive-only AI
- Security: server-side credit ledger + RLS, LLM / payment keys server-only
- Closed-loop credits (no cash-out) to avoid RBI prepaid-instrument rules; 18% GST noted
- No secrets in git; production stays static

Roadmap — Next Steps

- Verify live signup → 50-credit flow (in testing)
- Step 5: deploy Edge Functions + Anthropic key → AI on
- Step 6: Razorpay for credit purchases → flip charging on
- Activate ads + add Angel One / Upstox / Dhan affiliate links
- Phase D: Pro subscription (Rs 999/yr)
- Growth: SEO screen landing pages, shareable / community screens, preset-scan library

Status Summary

- Fully live: screener, charts, patterns, NL search, watchlists, alerts, accounts, cloud wallet with real credits, Zerodha affiliate earning
- Monetization rails built and staged
- Waiting on external accounts (Anthropic key, Razorpay, ad IDs) and the deliberate “go” to start charging
